STYRACON[®] Film Capacitors Hermetically-Sealed in Metal Cases

DESIGNED for special applications with such requirements as extremely high insulation resistance, freedom from dielectric absorption, extremely low power factor (or high Q), or for use where close capacitance tolerance or high capacitance stability is required, Sprague Styracon Film capacitors are finding use in many critical applications. Some typical applications are found in analog and digital computers, in precision timing circuits, in high Q tuned circuits, and integrating circuits in electronic equipment, and as laboratory standards of capacitance.

Styracon capacitors have as their dielectric a specially processed polystyrene plastic film.

The dielectric absorption, or the accumulation of charge after discharge, is extremely low. Styracon capacitors make excellent standards for the measurement of dielectric hysteresis or absorption in other capacitors.

The insulation resistance of Styracon capacitors at 25 C is well beyond the limit of accurate measurement of most $\bar{I}R$ meters. When determined by the decay of a charge across the capacitor itself, the product of insulation resistance and capacitance will generally exceed 10,000,000 megohm-microfarads. Because of the difficulty of making measurements of this magnitude, Sprague Styracon capacitors are guaranteed only to have an insulation resistance \times capacitance product in excess of

250,000 megohm-microfarads at 25 C.

2084

Styracon capacitors have a rated operating temperature range from -55 C to $+85$ C. The temperature co-efficient of capacitance is practically linear over this range with a value of approximately -120 ppm/ $^{\circ}$ C. The measured capacitance is also practically independent of frequency. Retrace characteristics of Styracon capacitors are excellent.

Styracon Capacitors are furnished not only to the customary "standard" tolerances ranging from $\pm 1\%$ through $\pm 20\%$, but are also available to meet special close tolerance requirements as tight as $\pm .1\%$. In addition, matched pairs of capacitors can be furnished for many of the standard tolerance spreads.

Sprague Styracon capacitors are available in various mechanical configurations to meet application needs. Cases most often used in industrial and military electronics and in computers include subminiature metal-clad tubulars and the drawn "bathtub" designs. All capacitors in this bulletin are hermetically sealed with glass-to-metal solder-seal terminals.

Capacitors will withstand the usual requirements for humidity resistance, temperature cycling, and immersion found in MIL capacitor specifications. Special constructions to withstand high acceleration, shock, and vibration requirements beyond MIL capacitor specifications are available.

TYPE 114P CASE STYLES

Leads are bare solid tinned wire. Lead wire sizes are:

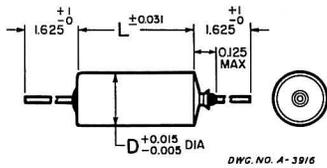

Can Dia.
 .175 and .195
 .235 to .312
 .400 and over

Lead AWG
 No. 24
 No. 22
 No. 20 except that style 15 and 16 capacitors
 will be furnished with No. 22 leads.

TYPICAL TAB TERMINAL DIMENSIONS

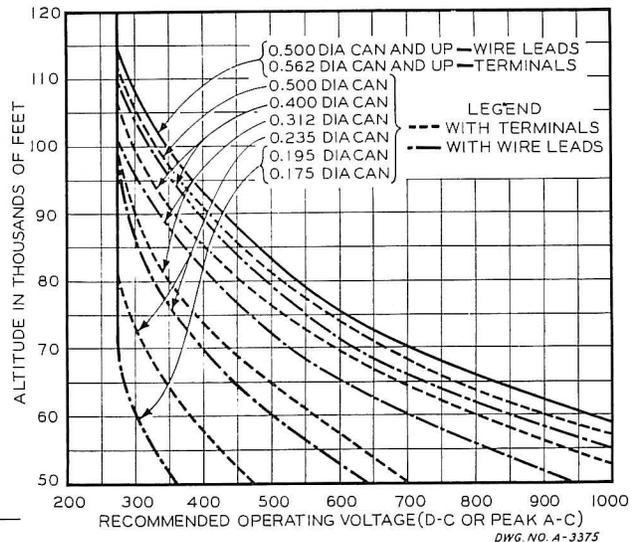

Application Notes

Mounting. Tubular capacitors should be mounted such that the leads are not required to withstand forces arising from the mass of the capacitor body where shock or high frequency vibration is likely to be encountered. The necessity for exercising great care in the use of a strap or clamp is emphasized. A clamp which pinches the body too tightly may injure it, either because of the stress produced in tightening or because of the aggravation of these stresses by vibration.

There are available, however, clamps designed to support capacitors subject to shock and vibration. Typical of these is the spring clip shown in the above photograph.

Altitude Limitations Capacitor bushing flashover voltage limitations should be taken into consideration when designing circuits for use in guided missiles and similar high altitude applications. The curves below give typical maximum voltages which should be taken into consideration when using Subminiature Paper Capacitors in electronic equipment. From the practical standpoint these curves indicate that it may sometimes be necessary to specify a higher working voltage capacitor in a larger diameter case in order to insure satisfactory operation of the finished equipment.

TYPE 114P – Tubular Cases with Extended Foil Sections

ALWAYS SPECIFY BY COMPLETE CATALOG NUMBER, SUCH AS:

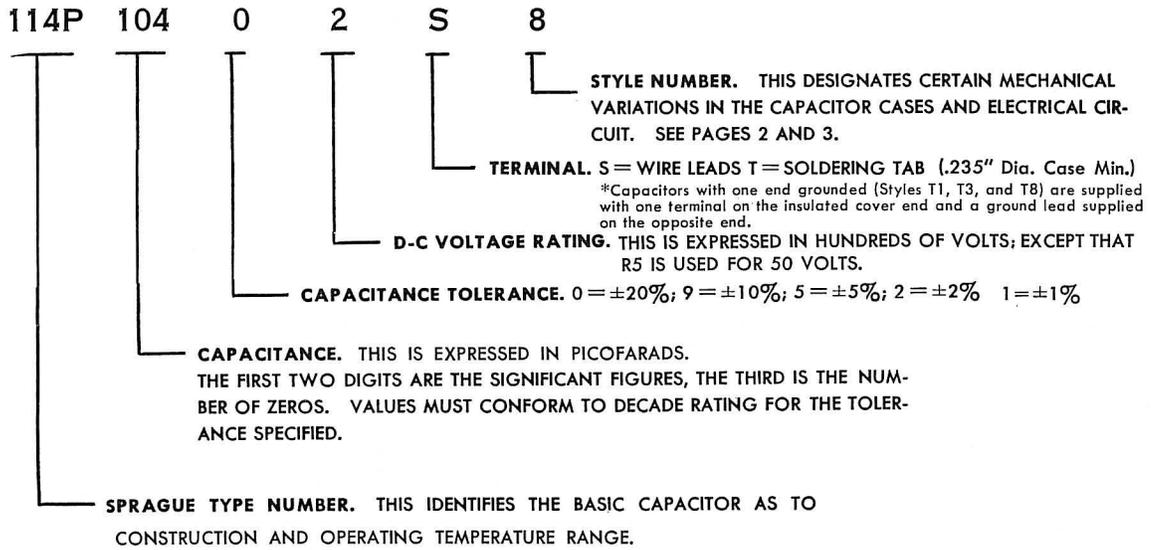

Table of Dimensions

For a complete catalog number, the capacitance code numbers listed in the following table must be pre-fixed with the designation 114P to indicate the construction type desired, and must be followed by a style number selected from the available styles shown on pages 2, 3 and 4. For example, 114P10402S3.

The tolerances allowed on the dimensions tabulated below are shown in the line drawings on pages 2, 3 and 4 which illustrate the available case styles.

It should be noted that for styles 8, 9, 15 and 16, the minimum can diameter available is .400 inch and for style 7 the minimum is .235 inch. Any combination of capacitance and voltage rating, for which the diameter shown in the table is smaller, will be furnished in Styles 8, 9, 15, and 16 in a can .400 inch in diameter or in Style 7 capacitors in a can .235 inch in diameter. The minimum lengths of Style 8 and 9 capacitors are tabulated on page 2. The minimum lengths of Style 15 and 16 capacitors are 0.687 and 0.750 inch, respectively.

Note: For units larger than .562 by 1.812, mounting by means of the lead wires is not recommended.

*For ±20% tolerance, substitute M for J; for ±10% tolerance, substitute K for J; for ±2%, G for J; and for ±1%, substitute F for J.

†No mounting ears are provided on this case. It is recommended that these capacitors be mounted using a wraparound bracket, fabricated by the user to best meet the chassis conditions in his particular equipment.

**ELECTRICAL
CHARACTERISTICS
vs
TEMPERATURE
for
STYRACON®
CAPACITORS—
TYPES 114P and 111P**

NOTE: Capacitance and dissipation factor measurements made at 60 cycles and 1000 cycles are the same for all practical purposes.

DWG. NO. D-1025E

PERFORMANCE CHARACTERISTICS

1. Temperature Range.

1.1 Operating. These capacitors are designed to operate over a temperature range of -65 C to $+85\text{ C}$.

1.2 Non-Operating. These capacitors must not exceed $+85\text{ C}$ under any conditions for any period of time. The capacitors are permanently damaged by temperatures in excess of $+85\text{ C}$.

1.3 For optimum capacitance stability, a maximum temperature of 65 C is recommended for both operating and non-operating conditions.

2. Insulation Resistance.

2.1 At 25 C. The minimum product of insulation resistance, expressed in megohms, and capacitance, expressed in microfarads, shall be 250,000 megohm-microfarads.

2.1.1 However, in no case need the insulation resistance exceed 250,000 megohms.

2.1.2 Where the case is not a terminal, the insulation resistance between the case and either terminal shall be at least 50,000 megohms.

2.2 At 85 C. The minimum product of insulation resistance, expressed in megohms, and capacitance, expressed in microfarads, shall be 40,000 megohm-microfarads.

2.2.1 However, in no case need the insulation resistance exceed 100,000 megohms.

2.3 Measurements shall be made after a two minute charge at the rated voltage or 500 volts d-c, whichever is less.

3. Capacitance and Tolerance. The capacitance of all capacitors shall be within the specified tolerance limits of the nominal rating.

3.1 Capacitors of $1\ \mu\text{F}$ or less in capacitance shall be measured at a frequency of 1000 cycles per second at 25 C , or else referred to measurements made at that frequency and temperature.

3.2 Capacitors of more than $1\ \mu\text{F}$ in capacitance shall be measured at a frequency of 60 cycles per second at 25 C or else referred to measurements made at that frequency and temperature.

4. Dissipation Factor. The maximum dissipation factor of all capacitors shall be 0.1% at 25 C .

4.1 Capacitors of $1\ \mu\text{F}$ or less in capacitance shall be measured at a frequency of 1000 cycles per second, or else referred to measurements made at that frequency.

4.2 Capacitors of more than $1\ \mu\text{F}$ in capacitance shall be measured at a frequency of 60 cycles per second, or else referred to measurements made at that frequency.

5. Voltage Test.

5.1 Capacitors shall withstand a d-c potential of twice the rated voltage applied between the terminals for two minutes.

5.2 When the case is not a terminal, the capacitors shall withstand for one minute a d-c potential of twice the rated voltage applied between the case and the terminals connected together.

5.3 The test voltage must be applied and discharged through a resistor of at least one ohm per volt.

6. Life Test. Capacitors shall withstand a test potential of 150% of rated voltage between terminals, or between terminals and case, if the case is a terminal, for a period of 250 hours at 85 C .

6.1 Not more than 1 failure shall be permitted in 12 units tested. Failure shall be considered to be any one of the following:

- (a) A permanent short or open circuit.
- (b) A change in capacitance of more than $\pm 2\%$.
- (c) A change in insulation resistance to less than 60% of the original limit when measured in accordance with section 2.
- (d) An increase in dissipation factor to more than the original limit when measured in accordance with section 4.

6.2 An alternate life test may be run at 65 C with not more than one failure permitted in 25 units tested. The requirements of 6.1 shall apply except that the capacitance change limit is 0.5% .

7. Temperature and Immersion Cycling. These capacitors will meet the temperature and immersion cycling tests of Military Specification MIL-C-19978.

8. Moisture Resistance. These capacitors will meet the moisture resistance tests of Military Specification MIL-C-19978.

9. Vibration.

9.1 All capacitors shown in this bulletin will withstand the 55 cycle vibration test in accordance with MIL-STD-202, method 201.

9.2 Type 114P Capacitors, Styles 1, 2, 3, 4, 12, 13, 15, 16, 25, and 26, shall withstand the 2000 cycle vibration test at $15g$ in accordance with MIL-STD-202, method 204, test condition B provided supplementary mounting is used for Styles 1, 2, 3, and 4.

9.3 As the result of these tests, there shall be no mechanical damage, and the measurement shall show no evidence of intermittent contacts or open or short circuiting.

PERFORMANCE CHARACTERISTICS (cont.)

10. Lead Pull Test. Capacitors with wire leads shall withstand a steady pull of 5 pounds applied axially to the leads for one minute.

11. Lead Bending Test. Leads shall withstand, without breakage, bending about the point of egress from the capacitor first 90° in one direction, then back to the original position, and then 90° in the opposite direction.

12. Dielectric Absorption. The dielectric absorption shall be less than 0.05%.

12.1 Dielectric absorption is determined by charging the capacitor to rated voltage for 5 minutes, discharging through a 5 ohm resistor for 10 seconds and then measuring the voltage which reappears across the terminals of the capacitor after

60 seconds have elapsed. A vacuum tube electrometer or similar instrument with an input of 10¹¹ ohms should be used to measure recovery voltage. The percentage is calculated as noted below:

$$\% \text{ Dielectric Absorption} = \frac{\text{Recovery Voltage} \times 100}{\text{Charging Voltage}}$$

12.1.1 Alternate Test Procedure. The test procedure for measuring dielectric absorption given in Military Specification MIL-C-19978 may be substituted for the test method of section 12.1. When measured by the military specification test method, dielectric absorption shall be less than 0.1%.

12.1.2 Because of limitations of test equipment currently available, it is not feasible to accurately determine dielectric absorption for capacitors rated less than 0.05 μF.

GUIDE TO APPLICATION AND OPERATION

1. Capacitance Drift and Temperature Coefficient:

1.1 The temperature coefficient of capacitance is the change in capacitance expressed in parts per million per degree Centigrade. It is normally computed from measurements made at a frequency of 1 kilocycle per second at 25 C and at the maximum specified temperature in the same temperature cycle.

1.2 The normal range of temperature coefficient of Styracon capacitors is -120 ppm/°C, ±50 ppm/°C.

1.3 The capacitance drift is defined as the percent deviation of the capacitance of the unit measured immediately before and after a temperature cycle.

1.4 The capacitance drift of typical units is less than ±0.2%.

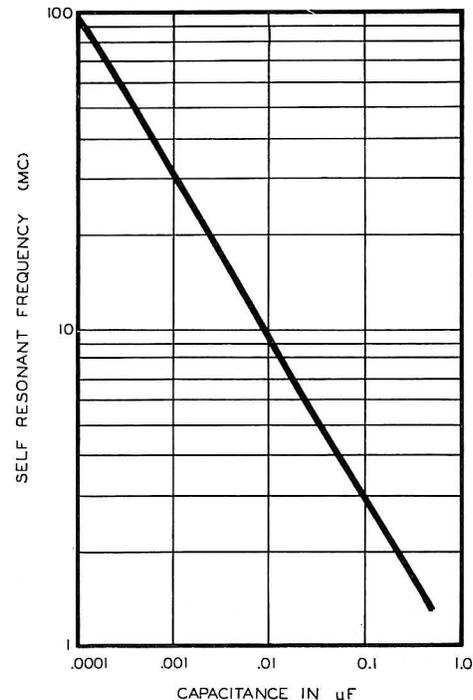

2. Tolerances:

2.1 In both tubular and bathtub constructions, the following tolerances are available other than the standard ±20%, ±10%, and ±5%:
±2%, ±1%, ±.5%, ±.25% ±.1%

2.2 Matched pairs or groups can be furnished from any of the above tolerance spreads.

2.3 Special tolerances are available upon request.

3. Long Term Stability: On the basis of shelf and life tests of a typical capacitor, it is known that the capacitance change will be substantially less than 0.1% after one year at temperatures between 20 C and 50 C.
